MET-SEAM[®] MSTrad STANDING SEAM ROOFING AND CLADDING	34-58

JULY 2011

MET-SEAM[®] MSPro **STANDING SEAM ROOFING** **AND CLADDING**

Ideal for roofs, facades, fascias or soffits
MET-SEAM[®] MSPro is a highly engineered standing seam system that gives a traditional appearance without incorporating traditional skills, long lead times, long installation programmes and high costs.

The panels are ...simple by design... with their unique and innovative design which simply snaps together, there is no need to use seaming or zipping up tools.

The standing seam which is only 40mm high gives a very clean, true and straight line, fixed using stainless steel clips and screws to a fully supported deck.

- 460mm, 410mm and 360mm wide panels
- Zinc, Copper, Aluminium, Steel and Stainless Steel
- As low as 10° pitch
- No 'Zipping Up' required
- No site profiling
- Reduced labour costs
- Fast site installation
- Secret fixed stainless steel fixings
- Fit and Forget

MET-SEAM[®] MSCas **CASSETTE PROFILE PANELS**

Ideal for facades and soffits the
MET-SEAM[®] MSCas cassette is a profiled panel that allows the specifier great flexibility in choice of finishes and widths. The cassettes are profiled along their length with one edge having a 'leg' and the other edge a 'grove'.

The cassettes are ...simple by design... and are connected to a metal or timber framework or a fully supported deck. Each mechanical fixing is covered and hidden from view by the next consecutive cassette, giving a complete secret fixed appearance.

The joints in the cassettes can be tight together or have a shadow gap and all fixings are stainless steel.

- Variety of widths available
- Zinc, Copper, Aluminium, Steel and Stainless Steel
- Fast site installation
- Bespoke cassettes available
- Secret fixed stainless fixings

MET-SEAM[®] MSTrad **STANDING SEAM ROOFING** **AND CLADDING**

Ideal for roofs, facades, fascias or soffits
MET-SEAM[®] MSTrad is a traditional profiled standing seam system that can be profiled in the factory or on site.

The standing seam which is only 25mm high are closed and seamed by hand on site. The system requires a fully supported deck and is fixed using two types of stainless steel clips which are welded into the seam during installation. Clips are fixed using stainless steel screws or nails.

MSTrad can also be curved to a radius giving even greater possibilities for the specifier.

- Variety of widths available
- Zinc, Copper, Aluminium, Steel and Stainless Steel
- As low as 3° pitch
- Curved panels available
- Secret fixed stainless steel fixings
- Fit and Forget
